The object of this paper is to solve a fractional integro-differential equation involving a generalized Lauricella confluent hypergeometric function in several complex variables and the free term contains a continuous function $f(\tau)$. The method is based on certain properties of fractional calculus and the classical Laplace transform. A Cauchy-type problem involving the Caputo fractional derivatives and a generalized Volterra integral equation are also considered. Several special cases are mentioned. A number of results given recently by various authors follow as particular cases of formulas established here.

1. Introduction and preliminaries

The first-order integro-differential equation of Volterra type [7, 9]

$$\frac{d}{d\tau} a(\tau) = -i\pi g_0 \int_0^\tau \zeta a(\tau - \zeta) \exp(i\nu \zeta) d\zeta$$

(1.1)

describes the unsaturated behavior of the free electron laser (FEL). Here $\tau$ is a dimensionless time variable, $g_0$ is a positive constant called the small signal gain, and the detuning parameter is the constant $\nu$. The function $a(\tau)$ is the complex-field amplitude which is assumed to be dimensionless satisfying the initial condition $a(0) = 1$. The exact closed form solution of (1.1) valid in the whole range of practical interest and suitable for numerical calculations was given by Dattoli et al. [8].

Fractional calculus has gained importance during the last three decades or so due to its various applications in the solution of fractional differential and fractional integral equations arising in various problems of physics engineering and applied sciences, such as diffusion in porous media, fractal geometry, kinematics in viscoelastic media, propagation of seismic waves, anomalous diffusion, and so forth. In this connection, one can refer to the works mentioned in [6, 12, 16, 18, 20, 21, 25].

The Riemann-Liouville operator of fractional integration of order $\nu$ is defined by

$$D_x^{-\nu}[h(x)] = \frac{1}{\Gamma(\nu)} \int_0^x (x - t)^{\nu - 1} h(t) dt \quad (\text{Re}(\nu) > 0),$$

(1.2)

provided that the integral (1.2) exists.
The Riemann-Liouville fractional derivative of order \( \nu \) is defined in the form \([19, 20, 21, 25]\)
\[
D_{x}^{\alpha} h(x) = \frac{1}{\Gamma(n-\alpha)} \frac{d^n}{dt^n} \int_{0}^{t} \frac{h(u)du}{(t-u)^{\alpha-n+1}} \quad (n-1 < \alpha \leq n). \tag{1.3}
\]

By the application of the convolution theorem of the Laplace transform \([11, \text{page 131}]\), we find from (1.2) that
\[
L\{D_{t}^{-\nu} h(t); s\} = L\left\{\frac{t^{\nu-1}}{\Gamma(\nu)} \right\} L\{h(t)\} = s^{-\nu}H(s), \tag{1.4}
\]
where \(H(s)\) is the Laplace transform of \(h(t)\) defined by
\[
L\{h(t) : s\} = \int_{0}^{\infty} h(t)e^{-st}dt =: H(s), \quad \text{Re}(s) > 0, \tag{1.5}
\]
which may be written symbolically as follows:
\[
H(s) = L\{h(t) : s\} \quad \text{or} \quad h(t) = L^{-1}\{H(s) : t\}, \tag{1.6}
\]
provided that the function \(h(t)\) is continuous for \(t \geq 0\) and of exponential order as \(t \to \infty\).

Boyadjiev et al. \([5, (7), \text{page 4}]\) studied the following nonhomogeneous form of fractional integro-differential equation of Volterra type:
\[
D_{t}^{\alpha} a(\tau) = \lambda \int_{0}^{\tau} \zeta a(\tau - \zeta) \exp(i\nu\zeta)d\zeta + \beta \exp(i\nu \tau), \quad 0 \leq \tau \leq 1, \tag{1.7}
\]
where \(\beta, \lambda \in \mathbb{C}\) and \(\nu \in \mathbb{R}\).

Al-Shammery et al. \([3, (14), \text{page 82}]\) considered a generalization of (1.4) in the form
\[
D_{t}^{\alpha} a(\tau) = \lambda \int_{0}^{\tau} u^{\beta} a(\tau - u) \exp(i\nu \tau)du + \beta \exp(i\nu \tau) \quad (0 \leq \tau \leq 1) \tag{1.8}
\]
with \(\beta, \lambda, \delta \in \mathbb{C}, \nu \in \mathbb{R}, \text{Re}(\alpha) > 0, \text{and Re}(\delta) > -1\).

Al-Shammery et al. \([2, (14), \text{page 503}]\) further studied another generalization of (1.7) in the form
\[
D_{t}^{\alpha} a(\tau) = \lambda \int_{0}^{\tau} u^{\delta} a(\tau - u) \Phi(b, \delta + 1; ivu)du + \beta \Phi(b', 1; i\nu \tau), \tag{1.9}
\]
where \(0 \leq \tau \leq 1, \alpha, \beta, \lambda, \delta \in \mathbb{C}; b, b' \in \mathbb{R}, \text{Re}(\alpha) > 0, \text{Re}(\delta) > 0, \text{and } \Phi(a, b; z)\) is the Kummer confluent hypergeometric function defined in \([10, (1), \text{page 248}]\).

Saxena and Kalla \([26]\) derived the solution of a further generalization of (1.9) in the form
\[
D_{t}^{\alpha} h(\tau) = \lambda \int_{0}^{\tau} t^{\delta} h(\tau - t) \Phi(b, \delta + 1; ivu)du + \mu \tau^{\gamma} \Phi(\beta, \gamma + 1; i\nu \tau), \tag{1.10}
\]
where \(0 \leq \tau \leq 1, \alpha, \delta, \lambda, \mu \in \mathbb{C}, \nu, b, \beta \in \mathbb{R}, \text{Re}(\alpha) > 0, \text{Re}(\gamma) > -1, \text{Re}(\delta) > -1\).
Recently Kilbas et al. [13] systematically studied a generalization of (1.10) in the following form:

\[ D_{\alpha}^{a}h(x) = \lambda \int_{a}^{x} (x-t)^{\mu-1} E_{\rho,\mu}^{\gamma} [\omega(x-t)^{\rho}] h(t) dt + f(x), \quad (1.11) \]

where \( a \leq x \leq b; \lambda, \mu, \rho, \gamma \in \mathbb{C}; \omega \in \mathbb{R}, \Re(\alpha) > 0, \Re(\mu) > 0, \) and \( f \) is assumed to be Lebesgue integrable over the interval \((a,b)\) and the function \( E_{\rho,\mu}^{\gamma}(z) \) is defined by [22]

\[ E_{\rho,\mu}^{\gamma}(z) := \sum_{r=0}^{\infty} \frac{(\gamma)^{r} z^{r}}{\Gamma(r \rho + \mu)(r!)}, \quad (1.12) \]

where \( \Re(\rho) > 0; (\gamma)^{n} := \Gamma(\gamma + n)/\Gamma(\gamma) \) is a generalization of the classical Mittag-Leffler functions \( E_{\rho}(z) \) and \( E_{\rho,\mu}(z) \). In terms of the \( H \)-function, we have [14]

\[ E_{\rho,\mu}^{\gamma}(z) = \frac{1}{\Gamma(\gamma)} H_{1,1}^{1,2} \left[ Z \right| \left( \frac{1}{0}, \frac{1}{0} \right) \right], \quad (1.13) \]

A comprehensive account of the various generalizations of FEL equations is recently given in a survey paper by Boyadjiev and Kalla [4]. A description of various special functions appearing in this paper is available in [1, 10, 11, 31].

A detailed account of various operators of fractional integration and their applications can be found in a recent survey paper of Srivastava and Saxena [32]. An interesting account of convolution integral equations has been given by Srivastava and Buschman [28].

The main object of the present paper is to introduce a further generalization of (1.11) in an interesting and unified form in which the generalized Mittag-Leffler function, the involved kernel, is replaced by a generalized Lauricella confluent hypergeometric function in several complex variables and the free term contains a continuous function \( f(\tau) \). The method followed here in finding the solution of Cauchy-type problem (3.1) and (3.2) and other Cauchy problems is based upon certain properties of fractional calculus and the classical Laplace transform. The solutions derived are in closed forms and are suitable for numerical computation.

2. Integral representations of generalized Lauricella confluent hypergeometric function of several complex variables

The following result is quite interesting and useful as it gives the inverse Laplace transforms of the product of binomial functions:

\[ L^{-1} \left\{ s^{-\lambda} \prod_{j=1}^{n} \left[ 1 - \frac{\omega_j}{s^{\rho_j}} \right]^{-\gamma_j} \right\} = t^{\lambda-1} F_{1,0}^{n+1,1} \left[ Z \left| \left( \frac{1}{0}, \frac{1}{0} \right) \right] - \frac{\omega_1 t^{\rho_1}, \ldots, \omega_n t^{\rho_n}}{\lambda} \right], \quad (2.1) \]

where \( \lambda, s, \gamma_j, \rho_j, \omega_j \in \mathbb{C}, \Re(s) > 0, \max_{1 \leq j \leq n} |\omega_j/s^{\rho_j}| < 1, \min_{1 \leq j \leq m} \Re(\rho_j) > 0, \Re(\lambda) > 0. \) The formula (2.1) can be easily established by expanding each of the binomial functions
appearing in (2.1) and interpreting it with the help of the formula

$$L^{-1}[s^{-\rho} : t] = \frac{t^{\rho-1}}{\Gamma(\rho)}, \quad \min\{\text{Re}(\rho), \text{Re}(s)\} > 0,$$

where the function

$$F_{1}^{0;1;1;1;0;0} \left[ \begin{array}{ccc}
- ; (y_1, 1) ; \ldots ; (y_n, 1) ; - \\
\omega_1 k_1, \ldots, \omega_n k_n
\end{array} ; \lambda : \rho_1, \ldots, \rho_n \right] \left( \begin{array}{c}
y : \rho_1, \ldots, \rho_n \end{array} : - : - \right)$$

(2.3)
is defined for complex $\lambda, y_j, \rho_j, \omega_j, z_j (\text{Re}(\rho_j) > 0)$ $j = 1, \ldots, n,$ in terms of a multiple series in the following form:

$$F_{1}^{0;1;1;1;0;0} \left[ \begin{array}{ccc}
- ; (y_1, 1) ; \ldots ; (y_n, 1) ; - \\
\omega_1, \omega_n k_n
\end{array} ; \lambda : \rho_1, \ldots, \rho_n \right] = \sum_{k_1, \ldots, k_n = 0}^{\infty} \frac{(y_1)_{k_1} \cdots (y_n)_{k_n} z_1^{k_1} \cdots z_n^{k_n}}{\Gamma[\lambda + \rho_1 k_1 + \cdots + \rho_n k_n](k_1)! \cdots (k_n)!},$$

(2.4)

which is a special case of the generalized Lauricella series in several complex variables, introduced by Srivastava and Daoust [29, page 454]. According to the convergence conditions investigated by Srivastava and Daoust [30, page 157] for the generalized Lauricella series in several variables, the series in (2.4) converges for Re($\rho_j$) > 0 for $j = 1, \ldots, n$. Its Mellin-Barnes type integral representation has been given by Saigo and Saxena [24, page 46] as

$$F_{1}^{0;1;1;1;0;0} \left[ \begin{array}{ccc}
- ; (y_1, 1) ; \ldots ; (y_n, 1) ; - \\
\omega_1, \omega_n k_n
\end{array} ; \lambda : \rho_1, \ldots, \rho_n \right] = \frac{1}{(2\pi i)^n} \int_{\Omega_1} \cdots \int_{\Omega_n} \frac{\prod_{j=1}^{n} \left[ \Gamma(y_j + s_j) \Gamma(-s_j) \right] \left\{ (-z_j)^s \right\}}{\Gamma[\lambda + \rho_1 s_1 + \cdots + \rho_n s_n]} ds_1 \cdots ds_n.$$

(2.5)

Here the contours $\Omega_j$’s are given by $\Omega_j = \Omega_{i \omega_j \infty} (i = (-1)^{1/2}, \text{Re}(s_j) = \nu_j)$ starting at the point $\nu_j - i \infty$ and terminating at the point $\nu_j + i \infty; \nu_j \in \mathbb{R} (j = 1, \ldots, n).$ All the poles of the gamma functions appearing in the integrand of (2.5) are assumed to be simple.

When $n = 1$, (2.1) reduces to the generalized Mittag-Leffler function due to Prabhakar [22] defined by (1.12), consequently the results obtained in this paper will generalize the work reported earlier by Kilbas et al. [13].

If we take $\rho_1 = \cdots = \rho_n = 1$ in (2.1), we arrive at a known result [11, page 222, Art. 4.24, equation (5)], namely, if $\text{Re}(s) > 0, |\omega_j|/s < 1, \min_{1 \leq j \leq n} \text{Re}(\rho_j) > 0, \text{Re}(\lambda) > 0, \lambda, \rho_j, y_j \in \mathbb{C} (j = 1, \ldots, n),$

$$L^{-1} \left\{ s^{\lambda} \prod_{j=1}^{n} \left( 1 - \frac{\omega_j}{s} \right)^{-y_j} \right\} = \frac{1}{\Gamma(\lambda)} t^{\lambda-1} \Phi_{2}^{(n)} [y_1, \ldots, y_n; \lambda; \omega_1 t, \ldots, \omega_n t],$$

(2.6)
which is defined as
\[ \Phi_2^{(n)}[\alpha_1, \ldots, \alpha_n; \lambda; z_1, \ldots, z_n] = \sum_{k_1, \ldots, k_n=0}^{\infty} \frac{(\alpha_1)_{k_1} \cdots (\alpha_n)_{k_n}}{(\lambda)_{k_1+\cdots+k_n}} \frac{z_1^{k_1} \cdots z_n^{k_n}}{(k_1)! \cdots (k_n)!} \] (max\{\|z_1\|, \ldots, \|z_n\|\} < \infty; \lambda \in \mathbb{Z}_0^+).

For \( n = 1 \), (2.1) yields the following result given by Kilbas et al. [14, page 37]; also see [22, page 11]: if \( \text{Re}(s) > 0, \text{Re}(\lambda) > 0, \text{Re}(\rho) > 0; |\omega/s^\rho| < 1; \lambda, \rho_j, \gamma, \omega, s \in \mathbb{C} \), then
\[ L[t^{\lambda-1}F_{\rho,\lambda}^\gamma(\omega t^\rho) : s] = s^{-\lambda} \left(1 - \frac{\omega}{s^\rho}\right)^{-\gamma}. \] (2.8)

**Remark 2.1.** Various practical problems of probability and statistics where \( \phi_2^{(n)}(\cdot) \) appears naturally are discussed by Mathai and Saxena [17].

By the application of the well-known convolution theorem of the Laplace transform, the following summation formula is obtained for the generalized Lauricella confluent hypergeometric function of “\( n \)” complex variables. Let \( \lambda, \mu, z_j, \rho_j, \gamma_j, \delta_j \in \mathbb{C}, \min\{\text{Re}(\lambda), \text{Re}(\mu)\} > 0, \min_{1 \leq j \leq m} \text{Re}(\rho_j) > 0, \max_{1 \leq j \leq m} \{\|z_j t^\rho\|\} < \infty (j = 1, \ldots, n) \), then
\[ \int_0^x t^{\lambda-1}F_{\rho,\lambda}^{\gamma,\delta}(\omega t^\mu) \, dt = x^\lambda \cdot t^{\mu-1} \int_0^x (x-t)^{\mu-1}F_{\rho,\lambda}^{\gamma,\delta}(\omega t^\mu) \, dt \]
\[ = x^{\lambda+\mu-1}F_{\rho,\lambda}^{\gamma,\delta}(\omega t^\mu) \]
(2.9)

If we set \( \delta_1 = \cdots = \delta_n = 0 \) in (2.9), it yields
\[ \int_0^x t^{\lambda-1}(x-t)^{\mu-1}F_{\rho,\lambda}^{\gamma,\delta}(\omega t^\mu) \, dt = x^{\lambda+\mu-1}F_{\rho,\lambda}^{\gamma,\delta}(\omega t^\mu) \]
(2.10)

which holds under the various conditions stated along with (2.9). If we set \( \rho_1 = \cdots = \rho_n = 1 \), then by virtue of the identity
\[ F_{\rho,\lambda}^{\gamma,\delta}(\omega t^\mu) = \frac{1}{\Gamma(\lambda)} \Phi_2^{(n)}[\alpha_1, \ldots, \alpha_n; \lambda; z_1, \ldots, z_n], \] (2.11)
the generalized Lauricella confluent hypergeometric function reduces to the Lauricella confluent hypergeometric function \( \Phi_2^{(n)}(\cdot) \) of “\( n \)” variables, and consequently we arrive at the following result recently given by Srivastava and Saxena [33]:

\[
\int_0^x t^{\lambda-1}(x-t)^{\mu-1}\Phi_2^{(n)}[a_1,\ldots,a_n;\lambda_1t,\ldots,\lambda_nt]
\]
\[
\times \Phi_2^{(n)}[b_1,\ldots,b_n;\lambda_1(x-t),\ldots,\lambda_n(x-t)]dt
\]
\[
= B(\lambda,\mu)x^{\lambda+\mu-1}\Phi_2^{(n)}[a_1+b_1,\ldots,a_n+b_n;\lambda+\mu;\lambda_1x,\ldots,\lambda_nx],
\]
(2.12)

where \( \min\{\Re(\lambda),\Re(\mu)\} > 0, \max\{|\lambda_1x|,\ldots,|\lambda_nx|\} < \infty \).

If we set \( b_1 = \cdots = b_n = 0 \) in (2.12), it yields

\[
\int_0^x t^{\lambda-1}(x-t)^{\mu-1}\Phi_2^{(n)}[a_1,\ldots,a_n;\lambda_1x,\ldots,\lambda_nx]dt
\]
\[
= B(\lambda,\mu)\Phi_2^{(n)}[a_1,\ldots,a_n;\lambda+\mu;\lambda_1x,\ldots,\lambda_nx],
\]
(2.13)

where \( \min\{\Re(\lambda),\Re(\mu)\} > 0, \max\{|\lambda_1x|,\ldots,|\lambda_nx|\} < \infty \).

When \( n = 1 \), we obtain the following result for the generalized Mittag-Leffler functions due to Kilbas et al. [13].

Let \( \alpha,\rho,\gamma,\delta,\lambda,\mu,\nu \in \mathbb{C}, \Re(\rho) > 0, \Re(\lambda) > 0, \Re(\mu) > 0, |zx^\rho| < 1 \), then

\[
\int_0^x t^{\lambda-1}E_{\rho,\lambda}^\nu(zt^\rho)(x-t)^{\mu-1}E_{\rho,\mu}^\nu[z(x-t)^\rho]dt = x^{\lambda+\mu-1}E_{\rho,\lambda+\mu}^{\nu+y}(zx^\rho).
\]
(2.14)

Let \( \gamma,\mu,\nu \in \mathbb{C}, \min\{\Re(\lambda),\Re(\mu)\} > 0, \Re(\rho) > 0 \), then if we set \( \delta = 1 \), (2.14) reduces to

\[
\int_0^x x^{\lambda-1}E_{\rho,\lambda}^\nu(zx^\rho)(x-t)^{\mu-1}E_{\rho,\mu}^\nu[z(x-t)^\rho] = x^{\lambda+\mu-1}E_{\rho,\lambda+\mu}^{\nu+1}(zx^\rho),
\]
(2.15)

where \( \min\{\Re(\lambda),\Re(\mu)\} > 0; |\lambda t| < 1 \). It is interesting to note that by virtue of the identity [13, (1.8), page 379], we arrive at a well-known result [10, (15), page 271]:

\[
\int_0^t u^{\lambda-1}(t-u)^{\mu-1}\Phi[\gamma,\lambda;zu]\Phi[\delta,\mu;z(t-u)]dt = B(\lambda,\mu)t^{\lambda+\mu-1}\Phi(\gamma+\delta,\lambda+\mu;zt),
\]
(2.16)

where \( \min\{\Re(\lambda),\Re(\mu)\} > 0 \).

Remark 2.2. A detailed and comprehensive account of the multiple Gaussian hypergeometric functions is available from Srivastava and Karlsson [31].

The following result will be found useful in the analysis that follows [19, 21]:

\[
L\{\partial_t^\alpha h(t)\} = s^\alpha H(s) - \sum_{k=0}^{n-1}s^{\alpha-k-1}\partial_t^{\alpha-k-1}h(t)\bigg|_{t=0} \quad (n-1 < \Re(\alpha) \leq n).
\]
(2.17)
3. Solution of the generalized fractional integro-differential equation

**Theorem 3.1.** Consider the following generalized integro-differential equation of Volterra type:

\[ D^\alpha_{\tau} h(\tau) = \kappa \int_0^\tau \zeta^{\alpha-1} h(\tau - \zeta) F^{0;1,\ldots,1}_{1;0,\ldots,0} \left[ \begin{array}{c} - (\alpha_1 : 1) ; \ldots ; (\alpha_n : 1) ; - \\ \omega_1 \zeta^{\rho_1}, \ldots, \omega_n \zeta^{\rho_n} \end{array} \right] d\zeta + \mu f(\tau), \tag{3.1} \]

where \( 0 \leq \tau \leq 1; \kappa, \gamma, \mu, \alpha_j, \rho_j, \omega_j \in \mathbb{C}; \min\{\Re(\alpha), \Re(\gamma)\} > 0; \Re(\rho_j) > 0 \) \((j = 1, \ldots, n)\), together with the initial conditions

\[ D^\alpha_{\tau} h(\tau) \bigg|_{\tau=0} = a_k \quad (k = 1, \ldots, N), \]

\[ (N := -[ - \Re(\alpha) ] : N - 1 < \Re(\alpha) \leq N; N \in \mathbb{N}), \tag{3.2} \]

where \( a_1, \ldots, a_N \) are prescribed constants and \( f(\tau) \) is assumed to be continuous on every finite closed interval \([0, T]\) \((0 < T < \infty)\), and of exponential order \(\exp(\eta \tau)\) when \(\tau \to \infty\). Then there exists a unique continuous solution of the Cauchy-type problem (3.1) and (3.2) given by

\[ h(\tau) = \sum_{k=1}^N a_k \Lambda_k(x) + \mu \int_0^\tau \Theta(\tau - \zeta) f(\zeta) d\zeta, \tag{3.3} \]

where

\[ \Lambda_k(\tau) = \tau^{\alpha-k} \sum_{r=0}^\infty \frac{\kappa^r \tau^{(\alpha+y)r}}{\Gamma[\alpha + (\alpha + y)r - k + 1]} \]

\[ \times F^{0;1,\ldots,1}_{1;0,\ldots,0} \left[ \begin{array}{c} - (\alpha_1 : 1) ; \ldots ; (\alpha_n : 1) ; - \\ \omega_1 \tau^{\rho_1}, \ldots, \omega_n \tau^{\rho_n} \end{array} \right] \]

\[ (\alpha + \alpha r + yr - k + 1 : \rho_1, \ldots, \rho_n) : - : - \] \tag{3.4}

\[ \Theta(\tau) = \tau^{\alpha-1} \sum_{r=0}^\infty \frac{\kappa^r \tau^{(\alpha+y)r}}{\Gamma[\alpha + (\alpha + y)r]} \cdot F^{0;1,\ldots,1}_{1;0,\ldots,0} \left[ \begin{array}{c} - (\alpha_1 r : 1) ; \ldots ; (\alpha_n r : 1) ; - \\ \omega_1 \tau^{\rho_1}, \ldots, \omega_n \tau^{\rho_n} \end{array} \right] \]

\[ (\alpha + \alpha r + yr : \rho_1, \ldots, \rho_n) : - : - \] \tag{3.5}

**Proof.** Applying the Laplace transform to (3.1) and using (2.17), we find that

\[ s^\alpha H(s) - \sum_{k=1}^N \frac{\kappa s^{-\alpha}}{s^{\alpha}} D^\alpha_{\tau} h(\tau) \bigg|_{\tau=0} = \kappa s^{-\alpha} \prod_{j=1}^n \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{-\alpha_j} H(s) + \mu F(s), \tag{3.6} \]

min\{\Re(\alpha), \Re(\gamma)\} > 0, \Re(s) > 0, where \( H(s) \) and \( F(s) \) represent, respectively, the Laplace transform of the functions \( h(\tau) \) and \( f(\tau) \).
Solving (3.6) under the initial conditions (3.2), we find that

\[
H(s) = \sum_{k=1}^{N} A_k s^{-\alpha - 1} \left[ 1 - \kappa s^{-\alpha} \prod_{j=1}^{n} \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{-\alpha_j} \right]^{-1} + \mu F(s) \left[ 1 - \kappa s^{-\alpha - \gamma} \prod_{j=1}^{n} \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{-\alpha_j} \right]^{-1},
\]

(3.7)

where it is tacitly assumed that

\[
\left| \kappa s^{-\alpha - \gamma} \prod_{j=1}^{n} \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{-\alpha_j} \right| < 1.
\]

(3.8)

By the application of the formula (2.1) once again, it is found from (3.7) that

\[
h(\tau) = \sum_{k=1}^{N} A_k \kappa^r \tau^{\alpha + (\alpha + \gamma)r - k} \frac{1}{\Gamma[\alpha + (\alpha + \gamma)r - k + 1]} \times F_{\frac{0}{1}}^{\frac{n}{0}}_{\frac{1}{0};\frac{1}{0};\ldots;\frac{1}{0}} \left[ \begin{array}{c}
\vdots \alpha r : 1; \ldots ; \alpha n r : 1; - \\
\omega_1 \tau^{\rho_1}, \ldots , \omega_n \tau^{\rho_n}
\end{array} \right] \left( \alpha + \alpha r + \gamma r - k + 1 ; \rho_1, \ldots , \rho_n \right) : - : -
\]

(3.9)

\[
+ \sum_{r=0}^{\infty} \kappa^r \int_{0}^{\tau} \frac{\tau - \zeta}{\Gamma[\alpha + (\alpha + \gamma)r]} \times F_{\frac{0}{1}}^{\frac{n}{0}}_{\frac{1}{0};\frac{1}{0};\ldots;\frac{1}{0}} \left[ \begin{array}{c}
\vdots \alpha r : 1; \ldots ; \alpha n r : 1; - \\
\omega_1 (\tau - \zeta)^{\rho_1}, \ldots , \omega_n (\tau - \zeta)^{\rho_n}
\end{array} \right] f(\zeta) d\zeta.
\]

(3.10)

The above expression can be expressed in the form (3.3). This completes the proof of Theorem 3.1.

In order to establish the uniqueness of the solution (3.3), we set \( \zeta = \tau - \zeta \) in (3.1) and operate upon both sides by \( D_{-r}^{-\alpha}(\Re(\alpha) > 0) \). Next, if we apply the Dirichlet formula [25] and make use of the Eulerian integral for the Beta function, we arrive at the following equation:

\[
h(\tau) = \mu D_{-r}^{-\alpha} f(\tau) + k \int_{0}^{\tau} h(\zeta)(\tau - \zeta)^{\alpha + \gamma - 1} \times F_{\frac{0}{1}}^{\frac{n}{0}}_{\frac{1}{0};\frac{1}{0};\ldots;\frac{1}{0}} \left[ \begin{array}{c}
\vdots \alpha r : 1; \ldots ; \alpha n r : 1; - \\
\omega_1 (\tau - \zeta)^{\rho_1}, \ldots , \omega_n (\tau - \zeta)^{\rho_n}
\end{array} \right] d\zeta.
\]

(3.10)

Since (3.10) is a Volterra integral equation with a continuous kernel, it does admit a unique continuous solution (see [15]).

Remark 3.2. The solution of the Cauchy-type problem (3.1) and (3.2) can also be developed by the method of successive approximations. In this connection, see [13, 23].
4. Special cases of Theorem 3.1

If we set

\[ \rho_1 = \cdots = \rho_n = 1, \tag{4.1} \]

then by virtue of the identity (2.10), we arrive at the following result recently obtained by Srivastava and Saxena [33].

**Corollary 4.1.** Under the various relevant hypotheses of Theorem 3.1, a unique continuous solution of the Cauchy-type problem involving the Volterra-type integro-differential equation

\[ D^\alpha_{\tau} h(\tau) = \frac{\kappa}{\Gamma(\gamma)} \int_{\tau}^{T} \zeta^{\gamma-1} h(\tau - \zeta) \Phi^{(n)}_2 [\alpha_1, \ldots, \alpha_n; \gamma; \omega_1 \tau, \ldots, \omega_n \tau] d\zeta + \mu f(\tau), \tag{4.2} \]

where \( 0 < \tau \leq 1, \alpha_j, \kappa, \gamma, \mu \in \mathbb{C}, \min \{ \Re(\alpha), \Re(\gamma) \} > 0, \) together with the initial conditions (3.2), is given by

\[ h(\tau) = \sum_{k=1}^{N} a_k \Omega_k(\tau) + \mu \int_{0}^{\tau} \Xi(\tau - t) f(t) d\zeta, \tag{4.3} \]

where

\[ \Omega_k(\tau) := \tau^{a-k} \sum_{r=0}^{\infty} \frac{\kappa^r \tau^{(a+\gamma)r}}{\Gamma[(\alpha + \gamma)r + \alpha - k + 1]} \times \Phi^{(n)}_2 [\alpha_1 r, \ldots, \alpha_n r; (\alpha + \gamma) r + \alpha - k + 1; \omega_1 \tau, \ldots, \omega_n \tau] \quad (k = 1, \ldots, N), \tag{4.4} \]

\[ \Xi(\tau) = \tau^{a-1} \sum_{r=0}^{\infty} \frac{\kappa^r \tau^{(a+\gamma)r}}{\Gamma[(\alpha + (\alpha + \gamma)r]} \cdot \Phi^{(n)}_2 [\alpha_1 r, \ldots, \alpha_n r; \alpha + (\alpha + \gamma)r; \omega_1 \tau, \ldots, \omega_n \tau]. \tag{4.5} \]

If we take \( n = 1, \) then Theorem 3.1 reduces to the following result given by Kilbas et al. [13].

**Corollary 4.2.** Under the various relevant hypotheses of Theorem 3.1, a unique continuous solution of the Cauchy-type problem involving the Volterra-type integro-differential equation

\[ D^\alpha_{\tau} h(\tau) = \kappa \int_{0}^{\tau} \zeta^{\gamma-1} h(\tau - \zeta) E^\varphi_{\rho,\mu} [\omega \zeta^\varphi] d\zeta + f(\tau), \tag{4.6} \]

\( 0 \leq \tau \leq 1; \kappa, \gamma, \rho, \omega, \mu \in \mathbb{C}; \min \{ \Re(\alpha), \Re(\gamma), \Re(\omega), \Re(\mu) \} > 0, \) together with the initial conditions (3.2), is given by

\[ h(\tau) = \sum_{k=1}^{N} a_k \Psi_k(\tau) + \int_{0}^{\tau} \Theta_1(\tau - \zeta) f(\zeta) d\zeta, \tag{4.7} \]
where

\[\Psi_k(\zeta) := \tau^{\alpha-k} \sum_{r=0}^{\infty} \kappa^r \tau^{(\alpha+\gamma)r} E_{\rho,\alpha+\gamma,r-k+1}^{Y}(\omega \tau^\rho) \quad (k = 1, \ldots, N),\]

\[\Theta_1(\tau) := \chi^{\alpha-1} \sum_{r=0}^{\infty} \kappa^r \tau^{(\alpha+\gamma)r} E_{\rho,\alpha+\gamma,r}^{Y}(\omega \tau^\rho).\]

If we set \(\rho = 1\) and use the identity [13, (1.8), page 379], Corollary 4.2 reduces to the following result given by Kilbas et al. [13, (4.8), page 391].

**Corollary 4.3.** Under the various relevant hypotheses of Theorem 3.1, a unique continuous solution of the Cauchy-type problem involving the Volterra-type integro-differential equation

\[D^{\alpha}_\tau h(\tau) = \frac{\kappa}{\Gamma(\gamma)} \int_0^\tau \zeta^{\gamma-1} h(\tau - \zeta) F_1(\beta; \gamma; \lambda \tau) d\zeta + \mu f(\tau) \quad (0 \leq \tau \leq 1, \beta, \gamma, \kappa, \mu \in \mathbb{C}, \min\{\Re(\alpha), \Re(\gamma)\} > 0),\]

(together with the initial conditions (3.2), is given by

\[h(\tau) = \sum_{k=1}^{N} a_k \vartheta_k(\tau) + \mu \int_0^\tau \theta(\tau - \zeta) f(\zeta) d\zeta,\]

where

\[\vartheta_k(\tau) := \tau^{\alpha-k} \sum_{r=0}^{\infty} \frac{\kappa^r \tau^{(\alpha+\gamma)r}}{\Gamma(\alpha + (\alpha + \gamma)r - k + 1)} F_1(\beta r; \alpha + (\alpha + \gamma)r - k + 1; \lambda \tau) \quad (k = 1, \ldots, N),\]

\[\theta(\tau) := \tau^{\alpha-1} \sum_{r=0}^{\infty} \frac{\kappa^r \tau^{(\alpha+\gamma)r}}{\Gamma(\alpha + (\alpha + \gamma)r)} F_1(\beta r; \alpha + (\alpha + \gamma)r; \lambda \tau).\]

**Remark 4.4.** In its further special case, when

\[f(\tau) = \frac{1}{\Gamma(\delta)} \tau^{\delta-1} F_1(\rho; \delta; \omega \tau),\]

then if we apply the integral addition formula (2.17), Corollary 4.3 would yield the main result of Saxena and Kalla [26, Theorem 1, page 91], which itself is a generalization of the result given earlier by Al-Shammery et al. [2, (14), page 504].

Next, if we set

\[f(\tau) = \tau^{\gamma-1} \left[ F_{0;0,0,\ldots,0}^{0;1,3,\ldots,1}(\omega_1 \tau^{p_1}, \ldots, \omega_n \tau^{p_n}) - \right] \]

and apply the general (multivariable) integral addition formula (2.9), then Theorem 3.1 gives us the following result.
Corollary 4.5. Under the various relevant hypotheses of Theorem 3.1, a unique continuous solution of the Cauchy-type problem involving the Volterra-type integro-differential equation

\[
D_t^\alpha h(x) = \kappa \int_0^\tau \zeta^{\alpha-1} h(\tau - \zeta) F_1^{0:1;\ldots;1}_{1:0;\ldots;0} \left[ \begin{array}{c}
- : (\alpha_1:1;\ldots;\alpha_n:1); \\
\omega_1 \zeta^{\rho_1}, \ldots, \omega_n \zeta^{\rho_n} \\
y: \rho_1, \ldots, \rho_n : - : - 
\end{array} \right] d\zeta + \mu t^{\alpha-1} F_1^{0:1;\ldots;1}_{1:0;\ldots;0} \left[ \begin{array}{c}
- : (\delta_1:1;\ldots;\delta_n:1); \\
\omega_1 t^{\rho_1}, \ldots, \omega_n t^{\rho_n} \\
v: \rho_1, \ldots, \rho_n : - : - 
\end{array} \right]
\]

(4.14)

where

\[
\Delta(\tau) := t^{\alpha+y-1} \sum_{r=0}^\infty \frac{\kappa^r \tau^{(a+y) r}}{\Gamma(\alpha + (\alpha+y) r)} F_1^{0:1;\ldots;1}_{1:0;\ldots;0} \left[ \begin{array}{c}
- : (\alpha_1 r + \delta_1:1;\ldots;\alpha_n r + \delta_n:1); \\
\omega_1 t^{\rho_1}, \ldots, \omega_n t^{\rho_n} \\
(\alpha + y r + \alpha + v: \rho_1, \ldots, \rho_n) : - : - 
\end{array} \right],
\]

(4.16)

and \( \Lambda_k \)'s are given in (3.4).

5. A Cauchy-type problem involving the Caputo fractional derivatives

In connection with certain investigations, especially in the theory of viscoelasticity and hereditary solid mechanics, Caputo introduced the following definition for the fractional derivative of order \( \alpha > 0 \) of a casual function \( f(t) \) (i.e., \( f(t) = 0 \) for \( t < 0 \)), which arose in several important earlier works (see, for details [21, page 78]):

\[
\frac{d^\alpha}{dt^\alpha} h(t) := h^{(m)}(t) \quad (\alpha = m \in \mathbb{N}_0 := \mathbb{N} \cup \{0\})
\]

(5.1)

\[
= \frac{1}{\Gamma(m-\alpha)} \int_0^t h^{(m)}(\tau) \frac{(t-\tau)^{m-\alpha-1}}{(t-\tau)^{m-\alpha}} d\tau \quad (m-1 < \alpha < m; \ m \in \mathbb{N}),
\]

(5.2)

where \( h^{(m)}(t) \) denotes the usual (ordinary) derivative of \( h(t) \) of order \( m \) (\( m \in \mathbb{N}_0 \)). It readily follows from the definitions (1.5) and (5.1) that

\[
L \left\{ \frac{d^\alpha}{dt^\alpha} h(t) : s \right\} = s^\alpha H(s) - \sum_{k=0}^{m-1} s^{\alpha-k-1} h^{(k)}(0) \quad (m-1 < \alpha \leq m; \ m \in \mathbb{N}),
\]

(5.3)

which is preferred for initial-value problems of physical sciences than (2.17), \( H(s) \) is given by (1.5).

The method of proof of Theorem 3.1 can now be applied mutatis mutandis in order to solve the following Cauchy problem involving Caputo derivatives defined by (5.1).
Theorem 5.1. Consider the following generalized fractional integro-differential equation of Volterra type

\[
\frac{d^\alpha}{d\tau^\alpha} h(\tau) = \kappa \int_0^\tau \xi^{\gamma-1} h(\tau - \xi) F_{\alpha_1,\ldots,\alpha_n}^{\nu_1,\ldots,\nu_n} \left[ - ; (\alpha_1 : 1) ; \ldots ; (\alpha_n : 1) ; - \right] \omega_1 \xi^{\rho_1}, \ldots, \omega_n \xi^{\rho_n} (y : \rho_1, \ldots, \rho_n) \xi^{-\omega_1 \xi^{\rho_1}, \ldots, \omega_n \xi^{\rho_n}} d\xi + \mu f(\tau),
\]

(5.4)

where \(0 \leq \tau \leq 1\); \(\kappa, \mu, \alpha_j, \rho_j, \omega_j \in \mathbb{C}\); \(\min\{\Re(\alpha), \Re(\gamma)\} > 0\); \(\Re(\rho_j) > 0 \ (j = 1, \ldots, n)\), together with the initial conditions

\[
\frac{d^k}{d\tau^k} h(\tau) \bigg|_{\tau=0} = b_k \quad (k = 1, \ldots, N)
\]

(5.5)

\((N := -[-\Re(\alpha)]; N - 1 < \Re(\alpha) \leq N; N \in \mathbb{N})\), where \(b_1, \ldots, b_N\) are prescribed constants and \(f(\tau)\) is constrained as in Theorem 3.1. Then there exists a unique continuous solution of the Cauchy-type problem (5.4) and (5.5) given by

\[
h(\tau) = \sum_{k=1}^N b_k \Lambda_k(\tau) + \mu \int_0^\tau \Theta(\tau - \xi) f(\xi) d\xi,
\]

(5.6)

where \(\Lambda_k(\tau) \ (k = 1, \ldots, N)\) and \(\Theta(\tau)\) are already defined by (3.4) and (3.5), respectively.

Clearly, the assertions of Theorems 3.1 and 5.1 would coincide when we set

\[
\alpha = N \quad (N \in \mathbb{N}).
\]

(5.7)

More interestingly, it is fairly straightforward to apply Theorem 5.1 in order to deduce analogues of Corollaries 4.1 and 4.2 for the corresponding Cauchy problems involving the Caputo fractional derivatives defined by (5.1). For example, by taking \(\rho_1 = \cdots = \rho_n = 1\), it yields the following analogues of Corollary 4.1 dealing with a more general Cauchy problem than that associated with FEL equation (1.1).

Corollary 5.2. Under the various relevant hypotheses of Theorem 3.1, a unique continuous solution of the Cauchy-type problem involving the Volterra-type integro-differential equation

\[
D_\tau^\alpha h(\tau) = \frac{\kappa}{\Gamma(\gamma)} \int_0^\tau t^{\gamma-1} h(\tau - t) \Phi_2^{(n)} [\alpha_1, \ldots, \alpha_n : y ; \omega_1 \xi^{\rho_1}, \ldots, \omega_n \xi^{\rho_n}] dt + f(\tau),
\]

(5.8)

where \(0 \leq \tau \leq 1\), \(y, \alpha_j, \kappa \in \mathbb{C}\); \(\min\{\Re(\alpha), \Re(\gamma)\} > 0\), together with the initial conditions (3.2) is given by

\[
h(\tau) = \sum_{k=1}^N b_k \Omega_k(\tau) + \int_0^\tau \Xi(\tau - t) f(t) dt,
\]

(5.9)

where \(\Omega_k(\tau) \ (k = 1, \ldots, n)\) and \(\Xi(\tau)\) are defined by (4.4) and (4.5), respectively.
6. Solution of the generalized Volterra integral equation

In this section, we present a generalization of the Volterra integral equation quite recently given by Srivastava and Saxena [33].

**Theorem 6.1.** The Volterra-type integral equation

\[
D_{\tau}^{-\gamma} h(\tau) = \kappa \int_{0}^{\tau} (\tau - \zeta)^{\gamma-1} h(\zeta) F_{1:0;1:0}^{0:1;1:0} \left[ -: (\alpha_1:1; \ldots; (\alpha_n:1); -) \right] \omega(\tau - \zeta)^{\rho_1}, \ldots, \omega_n(\tau - \zeta)^{\rho_n} \left( y: \rho_1, \ldots, \rho_n \right): : - - \right] d\zeta + \mu f(\tau) \tag{6.1}
\]

has its solution given explicitly by

\[
h(\tau) = -\mu \sum_{r=0}^{\infty} \kappa^{-r-1} \int_{0}^{\tau} (\tau - \zeta)^{m+\gamma r - \gamma r - \gamma - 1} \left( \frac{d^m}{d\zeta^m} f(\zeta) \right) \times F_{1:0;1:0}^{0:1;1:0} \left[ -: (\alpha(r+1):1; \ldots; (\alpha_n(r+1):1); -) \right] \omega(\tau - \zeta)^{\rho_1}, \ldots, \omega_n(\tau - \zeta)^{\rho_n} \left( m + \gamma r - \gamma r - y: \rho_1, \ldots, \rho_n \right): : - - \right] d\zeta \tag{6.2}
\]

\((0 \leq \operatorname{Re}(\gamma) < \min\{m, \nu\}; f \in \mathbb{C}^m[0, \infty); f^{(j)}(0) = 0 (j = 0, 1, \ldots, (m - 1); m \in \mathbb{N}; \kappa, \mu \in \mathbb{C}; \nu \geq 0). \operatorname{Re}(\rho_j) > 0).\)

**Proof.** In view of the results (1.4) and (2.1), if we apply the Laplace transform operator on both sides of Volterra integral equation (6.1), it readily follows that

\[
H(s) = \mu F(s) \left[ s^{-\gamma} - s^{\nu} \sum_{j=1}^{n} \left\{ \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{-\alpha_j} \right\}^{-1} \right], \tag{6.3}
\]

\(\nu \geq 0; \operatorname{Re}(\gamma) > 0, \operatorname{Re}(\nu) > \max\{0, \operatorname{Re}(\omega_j), \operatorname{Re}(\eta)\}, \max_{1 \leq j \leq n} |\omega_j/s^{\rho_j}| < 1, \operatorname{Re}(\rho_j) > 0 (j = 1, \ldots, n), \) where \(F(s)\) and \(H(s)\) denote the Laplace transforms of \(f(\tau)\) and \(h(\tau)\), respectively.

Now, if we assume that

\[
\left| \kappa^{-1}s^{-\gamma} - \kappa s^{-\gamma} \sum_{j=1}^{n} \left\{ \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{-\alpha_j} \right\}^{-1} \right| < 1, \tag{6.4}
\]

it is found from (6.3) that

\[
H(s) = -\mu \sum_{r=0}^{\infty} \kappa^{-r-1} s^{m-(v-\gamma)} \prod_{j=1}^{m} \left\{ \left( 1 - \frac{\omega_j}{s^{\rho_j}} \right)^{\alpha_j} \right\}^{\alpha_j(r+1)} \left[ s^m F(s) \right] \tag{6.5}
\]

\((0 < \operatorname{Re}(\gamma) < \min\{m, \nu\}; m \in \mathbb{N}; \nu \geq 0),\)

which leads us easily to the desired result (6.2) under the conditions stated along with Theorem 6.1. \(\square\)
When \( \rho_1 = \cdots = \rho_n = 1 \), then using the relation (2.12), it immediately yields the following result recently given by Srivastava and Saxena [33], which itself is a generalization of Srivastava’s result [27].

**Corollary 6.2.** The Volterra-type integral equation

\[
D_t^{-\nu} h(t) = \kappa \int_0^t (t - \zeta)^{\gamma - 1} h(\zeta) \cdot \Phi_2^{(n)}[\alpha_1, \ldots, \alpha_n; \gamma; \omega_1(t - \zeta), \ldots, \omega_n(t - \zeta)] d\zeta + \mu f(t) \tag{6.6}
\]

has its solution given explicitly by

\[
h(t) = -\mu \sum_{r=0}^\infty \kappa^{-r-1} \int_0^t \frac{(t - \zeta)^{m + (\gamma - \nu)r - \gamma - 1}}{\Gamma(m + (\nu - \gamma)r - \gamma)} \left( \frac{d^m}{d\zeta^m} f(\zeta) \right) \cdot \Phi_2^{(n)}[-\alpha_1(r+1), \ldots, -\alpha_n(r+1); m + (\nu - \gamma)r - \gamma; \omega_1(t - \zeta), \ldots, \omega_n(t - \zeta)] d\zeta \tag{6.7}
\]

\((0 < \text{Re}(\gamma) < \min\{m, \nu\}; f \in \mathbb{C}^m[0, \infty); f^{(j)}(0) = 0 \ (j = 0, 1, \ldots, m - 1); m \in \mathbb{N}; \kappa, \mu \in \mathbb{C}; \nu \geq 0).\)

Special Issue on
Singular Boundary Value Problems for Ordinary Differential Equations

Call for Papers

The purpose of this special issue is to study singular boundary value problems arising in differential equations and dynamical systems. Survey articles dealing with interactions between different fields, applications, and approaches of boundary value problems and singular problems are welcome.

This Special Issue will focus on any type of singularities that appear in the study of boundary value problems. It includes:

- Theory and methods
- Mathematical Models
- Engineering applications
- Biological applications
- Medical Applications
- Finance applications
- Numerical and simulation applications

Before submission authors should carefully read over the journal’s Author Guidelines, which are located at http://www.hindawi.com/journals/bvp/guidelines.html. Authors should follow the Boundary Value Problems manuscript format described at the journal site http://www.hindawi.com/journals/bvp/. Articles published in this Special Issue shall be subject to a reduced Article Processing Charge of €200 per article. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at http://mts.hindawi.com/ according to the following timetable:
