

**SOME PROPERTIES OF THE QUASIASYMPTOTIC OF
SCHWARTZ DISTRIBUTIONS
PART II: QUASIASYMPTOTIC AT 0**

Stevan Pilipović

Abstract. We give the definition of the quasiasymptotic behaviour at 0 of Schwartz distributions from \mathcal{D}' and compare this definition with the definition of the quasiasymptotic of tempered distributions at 0 [2].

1. Definitions. The quasiasymptotic behaviour at 0 of tempered distributions was considered in [8] and [2]. First we reformulate the definition from [2].

Definition 1. Let $f \in \mathcal{S}'$ and $c(x)$, $x \in (0, a)$, $a > 0$, be a measurable positive function. It is said that f has (in \mathcal{S}') the quasiasymptotic at 0 with respect to $c(1/k)$ if there is a $g \in \mathcal{S}'$, $g \neq 0$, such that

$$(1) \quad \lim_{k \rightarrow \infty} \left\langle \frac{f(x/k)}{c(1/k)}, \varphi(x) \right\rangle = \langle g(x), \varphi(x) \rangle, \quad \varphi \in \mathcal{S}.$$

In this case we write $f \sim^q g$ at 0 with respect to $c(1/k)$ (in \mathcal{S}').

We extend this definition.

Definition 2. Let $f \in \mathcal{D}'$ and c be as in Definition 1. It is said that f has (in \mathcal{D}') the quasiasymptotic at 0 with respect to $c(1/k)$ if there is a $g \in \mathcal{D}'$, $g \neq 0$, such that

$$(2) \quad \lim_{k \rightarrow \infty} \left\langle \frac{f(x/k)}{c(1/k)}, \varphi(x) \right\rangle = \langle g(x), \varphi(x) \rangle, \quad \varphi \in \mathcal{D}.$$

In this case we write $f \sim^q g$ at 0 with respect to $c(1/k)$ (in \mathcal{D}').

Obviously, if $f \in \mathcal{S}'$ and $f \sim^q g$ at 0 with respect to $c(1/k)$ (in \mathcal{S}') then $f \sim^q g$ at 0 with respect to $c(1/k)$ in \mathcal{D} .

THEOREM 1. *Let f and c satisfy conditions of Definition 2. Assume further that c is continuous. Then for some real number ν and some slowly varying function L at 0^+*

$$c(x) = x^\nu L(x), \quad x \in (0, a).$$

Moreover, g is homogeneous with the order of homogeneity ν .

(Slowly varying functions are studied in [4]).

Proof. Let $f \in \mathcal{D}$ be such that $\langle g, \varphi \rangle \neq 0$. For any $m > 0$ we have

$$\begin{aligned} \left\langle \frac{f(mx/k)}{c(m/k)}, \varphi(x) \right\rangle &\rightarrow \langle g(x), \varphi(x) \rangle, \quad k \rightarrow \infty, \\ \left\langle \frac{f(mx/k)}{c(1/k)}, \varphi(x) \right\rangle &\rightarrow \langle g(mx), \varphi(x) \rangle, \quad k \rightarrow \infty; \end{aligned}$$

$$(3) \quad \left(\frac{c(m/k)}{c(1/k)} \right) \left\langle \frac{f(mx/k)}{c(m/k)}, \varphi(x) \right\rangle \rightarrow \langle g(mx), \varphi(x) \rangle, \quad k \rightarrow \infty.$$

This implies that for any $m > 0$

$$(4) \quad \lim_{k \rightarrow \infty} \frac{c(m/k)}{c(1/k)} \text{ exists.}$$

From [4, 1.4] it follows that the limit function defined by (4) must be equal to m^ν , $m > 0$, and that for that $\nu \in \mathbb{R}$ and for some function L slowly varying at 0^+ one has

$$(5) \quad c(x) = x^\nu L(x), \quad x \in (0, a).$$

Also, (3) implies that $g(mx) = m^\nu g(x)$, $m > 0$, $x \in \mathbb{R}$, which completes the proof.

This theorem directly implies:

THEOREM 2. *Let f and c satisfy conditions of Definition 1 and let c be continuous. Then the assertion of Theorem 1 holds.*

Some obvious properties of the quasiasymptotic at 0 in S' are given in the next theorem.

THEOREM 3. *Let $f \in S'$ and $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in S'). Then: (i) if $g^{(m)} \neq 0$ then $f^{(m)} \sim^q g^{(m)}$ at 0 with respect to $(1/k)^{\nu-m} L(1/k)$ (in S'), $m \in \mathbb{N}$, (ii) $x^m f(x) \sim^q x^m g(x)$ at 0 with respect to $(1/k)^{\nu+m} L(1/k)$ (in S') if $m \in \mathbb{N}$ and $\nu \notin -\mathbb{N}$; (iii) if $\nu \in -\mathbb{N}$, $m \in \mathbb{N}$ and $m < |\nu|$, then $x^m f(x) \sim^q x^m g(x)$ at 0 with respect to $(1/k)^{\nu+m} L(1/k)$ (in S').*

The same assertions hold for the quasiasymptotic at 0 in \mathcal{D}'

The quasiasymptotic at 0 is a local property of a distribution. Namely,

THEOREM 4. *Let $f \in \mathcal{D}'$ and $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{D}'), and let $f_1 \in \mathcal{D}'$ be such that $f = f_1$ in some neighbourhood of zero. Then $f_1 \sim^q g$ at 0 with respect to $(1/k)^\nu \cdot L(1/k)$.*

Proof. Follows from the equality $\langle f(x), \varphi(kx) \rangle = \langle f_1(x), \varphi(kx) \rangle$ which holds for any $\varphi \in \mathcal{D}$ if $k > k_0(\varphi)$.

The same assertion holds for the quasiasymptotic at 0 (in \mathcal{S}'). This was proved in [2, Lemma 1.6].

THEOREM 5. *Let $f \in \mathcal{S}'$, resp. $f \in \mathcal{D}'$, and $f \sim^q g$ at 0 with respect to $c(1/k)$ (in \mathcal{S}' , resp. in \mathcal{D}'). Let $\omega \in \mathcal{S}$, resp. $\omega \in \mathcal{E}$ and*

$$\frac{\omega(x/k)}{c_1(1/k)} \rightarrow \omega_0(x) \text{ in } \mathcal{S}, \text{ resp. in } \mathcal{E}, \text{ as } k \rightarrow \infty,$$

where $c(x)$, $x \in (0, a)$, $a > 0$, is a measurable positive function. Then $f\omega \sim^q \omega_0 g$ at 0 with respect to $c(1/k)c_1(1/k)$ (in \mathcal{S}' , resp. in \mathcal{D}').

Proof. Follows from [7, Y. I, p. 72., Théorème X].

2. Relations between two definitions. Let $f \in \mathcal{S}'$ and $f \sim^q g$ at 0 with respect to $c(1/k)$ (in \mathcal{D}'). The question is: Does the same hold in \mathcal{S}' ? We shall prove in this section that for $c(1/k) = (1/k)^\nu L(1/k)$, $k > 1/a$, the answer to the question is affirmative if $\nu > 0$ or if $0 \geq \nu > -1$ and L is bounded in some interval $(0, \eta)$, $\eta > 0$. Otherwise the problem is still open.

Theorem 3(i) and [2, Lemma 1.7] directly imply the following:

THEOREM 6. *Let $f \in \mathcal{S}'$ and $f = F^{(m)}$ in some neighbourhood of 0, where $m \in \mathbb{N}_0$ and F is a locally integrable function such that for some $\nu > -1$, L and $(C_+, C_-) \neq (0, 0)$,*

$$\lim_{x \rightarrow \pm 0} \frac{F(x)}{|x|^\nu L(|x|)} = C_\pm.$$

Then $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{S}'), where $g = (C_+ x_+^\nu + C_- x_-^\nu)^{(m)}$, and $x_\pm^\nu = H(\pm x) |x|^\nu$ (H is the Heaviside function).

The following theorem is proved in [P].

THEOREM 7. *Let $f \in \mathcal{S}$, $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{D}'), where $\nu > 0$. Then there is a continuous function $F(x)$, $x \in (-1, 1)$ and an $m \in \mathbb{N}_0$ such that $f = F^{(m)}$ in $(-1, 1)$ and*

$$\lim_{x \rightarrow \pm 0} \frac{F(x)}{|x|^{\nu+m} L(|x|)} = C_\pm. \text{ for some } (C_+, C_-) \neq (0, 0)$$

If $0 \geq \nu > -1$ and $L(x)$ is bounded in some interval $(0, \eta)$, the assertion holds as well.

Theorems 6 and 7 directly imply the following

THEOREM 8. *Let f satisfy conditions of Theorem 7. Then $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{S}').*

For $\nu < 0$ we have a partial answer to the question above.

Let us denote by \mathcal{Z} the space of Fourier transformations of elements from \mathcal{D} supplied by the convergence structure transported from $\mathcal{D}(\mathcal{Z} = \mathcal{F}(\mathcal{D}))$. Let $f \in \mathcal{S}'$. We write $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{Z}') if $g \in \mathcal{Z}'$, $g \neq 0$, and

$$\lim_{k \rightarrow \infty} \left\langle \frac{f(x/k)}{(1/k)^\nu L(1/k)}, \varphi(x) \right\rangle = \langle g(x), \varphi(x) \rangle, \varphi \in \mathcal{Z}.$$

Using the Fourier Transformations and Theorem I (i) (Part I) one can easily obtain that $g \in \mathcal{S}'$.

THEOREM 9. *Let $f \in \mathcal{S}'$ and $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{Z}') where $\nu < 0$, and $\nu \notin -\mathbf{N}$. Then $f \sim^q q$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{S}').*

Proof. Since for some $m \in \mathbf{N}_0$ and some continuous function F of slow growth $f = F^{(m)}$, the Fourier transformation implies

$$(-i)^m x^m \hat{F}(x) \sim^q \hat{g}(x) \text{ at } \pm \infty \text{ with respect to } k^{-\nu-1} L_1(k)$$

in the sense of convergence in \mathcal{D}' and thus, in the sense of convergence in \mathcal{S}' (see Theorem I, Part I). $L_1(\cdot) = L(1/\cdot)$ is slowly varying at ∞ . Let us put

$$\hat{F}_+(x) = \begin{cases} \hat{F}(x), & x > 0 \\ 0, & x \leq 0 \end{cases} \quad \hat{F}_-(x) = \begin{cases} 0, & x \geq 0 \\ \hat{F}(x), & x < 0 \end{cases}$$

[2, Lemma 2.2] implies that for some $N \in \mathbf{N}$ and some $(C_+, C_-) \in \mathbf{C}^2$, $(C_+, C_-) \neq (0, 0)$

$$x^{m+N} \hat{F}_\pm(x) \sim^q C_\pm f_{-\nu+N}(\pm x) \text{ at } \pm \infty \text{ with respect to } k^{-\nu-1+N} L_1(k).$$

Now [2, Lemma 2.3] implies, for $-\nu - m > 0$

$$(6) \quad \hat{F}_\pm(x) \sim^q C_\pm f_{-\nu-m}(\pm x) \text{ at } \pm \infty \text{ with respect to } k^{-\nu-1-m} L_1(k).$$

and for $-\nu - m < 0$.

(7)

$$\hat{F}_\pm(x) \sim^q C_\pm f_{-\nu+N}(\pm x) + \sum_{j=0}^p a_{j\pm} \delta^{(j)}(x) \text{ at } \pm \infty \text{ with respect to } k^{-\nu-1-m} L_1(k).$$

Using the Inverse Fourier transformation we obtain: for $-\nu - m > 0$

$$F(t) \sim^q \mathcal{F}^{-1}(C_+ f_{-\nu-m}(t) + C_- f_{-\nu-m}(-t))$$

at 0 with respect to $(1/k)^{\nu+m} L(1/k)$ (in \mathcal{S}');

for $-\nu - m < 0$

$$F(t) \sim^q \mathcal{F}^{-1}(\tilde{C}_+ f_{-\nu-m}(t) + \tilde{C}_- f_{-\nu-m}(-t) + \sum_{j=0}^p a_{j+} \delta^{(j)}(t) +$$

$$+ \sum_{j=0}^p a_{j-} \delta^{(j)}(t)) \text{ at 0 with respect to}$$

$$(1/k)^{\nu+m} L(1/k) \text{ (in } \mathcal{S}'\text{), } ((\tilde{C}_+, \tilde{C}_-) \neq (0, 0)).$$

Now Theorem 3 (i) completes the proof.

The proof of Theorem 9 shows that if ν and m satisfy the condition $-\nu - m > 0$, then the assertion of Theorem 9 holds without the asymptotic $\nu \notin -\mathbf{N}$.

At the end we give a theorem which is a consequence of Theorem 5 from part I.

THEOREM 10. *Let $f \in \mathcal{S}'$ such that $xf \sim^q g$ at 0 with respect to*

$$(1/k)^{\nu+1}L(1/k), \nu \in \mathbf{R} \setminus (-\mathbf{N}) \text{ (in } \mathcal{S}').$$

Let $\varphi_0 \in \mathcal{D}$ such that $\hat{\varphi}_0(0) = 1$ and

$$\left\langle \frac{f(x/k)}{(1/k)^\nu L(1/k)}, \hat{\varphi}_0(x) \right\rangle \rightarrow \langle g_0(x), \hat{\varphi}_0(x) \rangle \text{ as } k \rightarrow \infty$$

such that $g_0 \in \mathcal{S}'$ and $xg_0(x) = g(x)$, $x \in \mathbf{R}$. Then, $f \sim^q g$ at 0 with respect to $(1/k)^\nu L(1/k)$ (in \mathcal{S}') (g and g_0 are homogeneous of order $\nu+1$ and ν , respectively).
