

A PROPERTY OF THE CLASS OF FUNCTIONS WHOSE DERIVATIVE HAS A POSITIVE REAL PART

Milutin Obradović

Abstract. We give a subordination relation for the functions $f(z)/z$ where f belongs to the class of analytic functions in $|z| < 1$ for which $\operatorname{Re}\{f'(z)\} > 0$. Some consequences are also given.

Let A denote the class of functions of the form $f(z) = z + \sum_{k=2}^{\infty} a_k z^k$ which are analytic in the unit disc $U = \{z : |z| < 1\}$.

Let $f(z)$ and $F(z)$ be analytic in the unit disc U . The function $f(z)$ is subordinate to $F(z)$, if $F(z)$ is univalent, $f(0) = F(0)$ and $f(U) \subset F(U)$. For this relation the following symbol $f(z) \prec F(z)$ or $f \prec F$ is used.

For a function $f(z) \in A$ we say that it belongs to the class $P'[a, b]$, $-1 \leq b < a \leq 1$ if and only if

$$(1) \quad f'(z) \prec (1 + az)/(1 + bz).$$

Geometrically, this means that the image of U under $f'(z)$ is inside the open disc centered on the real axis whose diameter has end points $(1 - a)/(1 - b)$ and $(1 + a)/(1 + b)$. From this we conclude that $f'(z)$ has a positive real part and it is univalent in U ([8]). For example, $P'[1, -1]$ is the class of functions for which $\operatorname{Re}\{f'(z)\} > 0$, $z \in U$, and $P'[1 - 2\alpha, -1]$ is the class for which $\operatorname{Re}\{f'(z)\} > \alpha$, $0 \leq \alpha < 1$, $z \in U$. Various results for such functions are given, for example, in [1, 3, 7].

Further we cite the following definition [8]. We suppose that $f(z)$ is analytic in U . The function $f(z)$, with $f'(0) \neq 0$, is convex if and only if $\operatorname{Re}\{1 + zf''(z)/f'(z)\} > 0$, $z \in U$. Such a function belongs to the class of univalent functions in U .

The first-order differential subordination with many interesting applications is considered by Miller and Mocany in [5]. (For the general theory of differential

subordinations see [4]). Namely, if $\psi : \mathbf{C}^2 \rightarrow \mathbf{C}$ is analytic in a domain D , if $h(z)$ is univalent in U , and if $p(z)$ is analytic in U with $(p(z), zp'(z)) \in D$, $z \in U$, then $p(z)$ is said to satisfy the first order differential subordination if

$$(2) \quad \psi(p(z), zp'(z)) \prec h(z).$$

The univalent function $q(z)$ is said to be a dominant of the differential subordination (2) if $p(z) \prec q(z)$ for all $p(z)$ satisfying (2). If $\tilde{q}(z)$ is a dominant of (2) and $\tilde{q}(z) \prec q(z)$ for all dominants $q(z)$ of (2), then $\tilde{q}(z)$ is said to be the best dominant of (2).

In this paper we give a subordination relation for $f(z)/z$, where $f(z) \in P'[a, b]$. Also we give some estimates of $Re\{f(z)/z\}$ for certain $f(z) \in P'[a, b]$.

For these results we need the following lemma which is derived from a theorem due to Miller and Mocanu [5, Th 3, p. 190].

LEMMA 1. *Let $q(z)$ be a convex function in U and let $p(z)$ be analytic in U with $p(0) = q(0)$. If*

$$(3) \quad p(z) + zp'(z) \prec q(z) + zq'(z)$$

then $p(z) \prec q(z)$, and $q(z)$ is the best dominant in (3).

By using this lemma we derive

THEOREM 1. *Let $f(z) \in P'[a, b]$, $-1 \leq b < a \leq 1$. Then*

$$(i) \quad \frac{f(z)}{z} \prec \frac{a}{b} + \left(1 - \frac{a}{b}\right) \frac{\ln(1+bz)}{bz} \quad \text{for } b \neq 0;$$

$$(ii) \quad \frac{f(z)}{z} \prec 1 + \frac{a}{2}z \quad \text{for } b = 0,$$

and these are the best dominants.

Proof. We denote by

$$(4) \quad q(z) = \frac{a}{b} + \left(1 - \frac{a}{b}\right) \frac{\ln(1+bz)}{bz} \quad (b \neq 0),$$

and we show that $q(z)$ is a convex function in U . Indeed consider the function

$$(5) \quad q_1(z) = \frac{2(z - \ln(1+z))}{z} = 2 \left(1 - \frac{\ln(1+z)}{z}\right) = z + 2 \sum_{n=2}^{\infty} (-1)^{n-1} \frac{z^n}{n+1}.$$

Since the function $q(z) = z/(1+z)$ is convex in U , then the function

$$G(z) = \frac{2}{z} \int_0^z q(z) dz = q_1(z)$$

is also convex in U (Libera [2]). Therefore, from (5) we get that $z^{-1} \ln(1+z) = 1 - q_1(z)/2$ is convex in U , and this is true for $(bz)^{-1} \ln(1+bz)$. (see [8], i. e. for the function $q(z)$).

Further we have that

$$(6) \quad q(z) + zq'(z) = (zq)' = (1 + az)/(1 + bz).$$

Now, let $p(z)$ be analytic in U with $p(0) = q(0) = 1$. Then from Lemma 1 we have that the following implication

$$(7) \quad p(z) + zp'(z) \prec (1 + az)/(1 + bz) \Rightarrow p(z) \prec q(z)$$

is true and that $q(z)$ is the best dominant. If we set $p(z) = f(z)/z$, then from (7) we obtain the result (i) of Theorem 1.

The proof in the case (ii) is similar as in the case (i).

If we put $a = 1 - 2\alpha$, $0 \leq \alpha < 1$ and $b = -1$, then we have the following.

COROLLARY 1. *Let $f(z) \in A$ and let $Re\{f'(z)\} > \alpha$, $0 \leq \alpha < 1$. Then*

$$(8) \quad f(z)/z \prec 2\alpha - 1 - 2(1 - \alpha)z^{-1} \ln(1 - z)$$

and this is the best dominant.

For the next corollaries of Theorem 1 we need the following

LEMMA 2. *Let $|z| < r$, $0 < r \leq 1$. Then*

$$(9) \quad Re\{z^{-1} \ln(1 + z)\} > r^{-1} \ln(1 + r).$$

This estimate is sharp.

Proof. As we showed in the proof of Theorem 1, the function $g(z) = [\ln(1 + z)]/z$ is convex in $|z| < r$, $0 < r \leq 1$. Since it has real coefficients, then the image of $|z| < r$ by $g(z)$ is convex and symmetrical with respect to the real axis. Then we have

$$\inf_{|z| < r} Re\{g(z)\} = \min\{g(-r)\} = r^{-1} \ln(1 + r),$$

and from this the estimate (9) follows.

From Theorem 1 and Lemma 2, we get directly

COROLLARY 2. *Let $f(z) \in P'[a, b]$, with $-1 \leq b < a \leq 1$ and $b < 0$, then*

$$(10) \quad Re\left\{\frac{f(z)}{z}\right\} > \frac{a}{b} - \left(1 - \frac{a}{b}\right) \frac{\ln(1 - b)}{b},$$

The function $q(z)$ defined by (4) shows that the bound (10) is sharp.

Especially, for $a = 1 - 2\alpha$ and $b = -1$ from (10) of Corollary 2, we obtain

COROLLARY 3. *Let $f(z) \in A$ and $Re\{f'(z)\} > \alpha$, $0 \leq \alpha < 1$. Then*

$$Re\{f(z)/z\} > 2\alpha - 1 + 2(1 - \alpha) \ln 2,$$

and this result is sharp.

This improves an earlier result by the author [6].

The author would like to thank the referee for a careful reading and some useful suggestions.
